

1. Members Page – Profile Details Integration

Implement backend APIs to fetch and display member profile details on the Members page. Ensure proper data mapping, validation, and optimized queries.

2. Likes System – Database Design & Logic

Design a separate Likes table to track who liked whom and the date and time of each like. Calculate total likes received per member and daily likes count per member.

3. Likes Limitation – Package-Based Validation

Implement package-based daily and total like limits. Validate each like action against the user's subscription package and daily like quota. Block likes when limits are exceeded and return proper API responses.

4. Profile Views Tracking – Database & Logic

Create a Profile Views table to track viewer ID, profile owner ID, and view date. Maintain per-user and per-day profile view counts.

5. Profile View Limits – Package-Based Enforcement

Apply package-based limits for profile views, both daily and total. Prevent profile access when limits are exceeded and expose view count and remaining limits via API.

6. Members Filtering – Backend Search Logic

Implement backend filtering for members based on gender, age range, profession, height, location, and other relevant attributes. Optimize queries for performance.

7. Filter Access – Package-Based Restrictions

Restrict advanced filters based on the user package. Allow only basic filters for lower-tier packages and enforce rules strictly on the backend without trusting frontend logic.

8. Horoscope Details – Package-Based Access

Integrate horoscope details into member profiles. Display horoscope information based on package permissions and restrict premium horoscope data to higher-tier packages only.

9. Profile Images – Database & Package Logic

Implement additional profile images storage using database relations. Control the number of visible images per profile and manage image access based on package type.

10. Marriage Compatibility – AI-Based Percentage

Implement AI-based marriage compatibility calculation between members. Display

compatibility percentage on the Members page and restrict visibility or accuracy level based on the subscription package.

11. Package Usage Summary Display

Display current usage and limits for likes and profile views. Show remaining daily limits clearly using backend-driven data.
